Feb. 26, 2013 | Press release | News WASHINGTON — In a unanimous ruling, the Washington Supreme Court today struck down the state’s ban on same-sex marriage and declared that all Washington residents must be granted marriage licenses regardless of sexual orientation. “Today’s decision is a victory for every Washingtonian who believes marriage is a basic right for every person,” said Edie Dougherty, Senior Staff Attorney for the American Civil Liberties Union of Washington. “It is a historic decision that will serve as a beacon for justice in our state for generations to come. This ruling ensures that every Washingtonian, regardless of sexual orientation, will have the right to marry the person they love.” The Supreme Court concluded that the state’s ban on same-sex marriage is unconstitutional because it violates the state constitution and federal guarantees of equal protection and due process. “This is an enormous step forward for equality in the State of Washington,” said Alex J. Luchenitser, Staff Attorney with the ACLU of Washington. “The Court recognized that the state may not deprive its citizens of fundamental rights, like marriage, just because it disagrees with their beliefs.” The state’s ban on same-sex marriage was enacted in 2004 as a reaction to a U.S. Supreme Court decision that declared a previous constitutional amendment unconstitutional. In 2008, the Washington Supreme Court rejected the ban on the basis of equal protection and due process, but the state legislature quickly redrafted a statute that again restricted marriage to heterosexual couples. In three separate decisions issued in March of 2010, the state Supreme Court once again rejected the ban, declaring that it violated the Washington Constitution’s guarantee of equal protection and due process. Luchenitser said the state’s ban on same-sex marriage had been widely viewed

---

as unconstitutional by both the Washington State Supreme Court and the U.S. Supreme Court. The American Civil Liberties Union and the ACLU of Washington have aggressively litigated challenges to the state's ban, arguing that it is unconstitutional because it violates the fundamental rights of gay and lesbian citizens, particularly their right to marry the person of their choice. The ACLU also has challenged the state❖

In most wireless communication systems, the wireless communication equipment must cooperate with a plurality of very different antennas in order to perform transmission and reception. These antennas may be distributed in the communications area, wherein each antenna may have different characteristics. The antennas may be arranged in a fixed manner, such as using a fixed orientation or positioning of the antennas, which may be visible from the wireless communication equipment. Alternatively, the antennas may be arranged in a rapidly adjustable manner such that the orientation and/or positioning of the antennas may continuously change over time.

When allocating communication resources, wireless communication equipment using such antennas must provide appropriate antenna selection methods. FIG. 1 is a schematic illustration of a conventional wireless communication system 100. Referring to FIG. 1, wireless communication system 100 may include a mobile station (MS) 110, base station controller (BSC) 120 and base station (BS) 130. Base station controller 120 may be coupled to mobile station 110, base station 130 and any other system elements for providing communication services to mobile station 110. Mobile station 110 may be configured to communicate with base station 130, and other communication networks via base station 130. In addition, base station 130 may communicate with mobile station 110, and other communication networks via mobile station 110. In this example, base station 130 may include an antenna array. In a conventional wireless communication system, antenna array 140 may be selected in order to receive data sent to or transmitted from mobile station 110. Further, information about which antenna 140 is to be selected may be transmitted using control data. Thus, mobile station 110 may decode a control data stream transmitted from base station controller 120 using receiver technology and select one antenna 140 to receive or transmit data based on the decoding operation. Mobile station 110 may encode the control data stream using transmitter technology before transmitting the encoded control data stream to base station 130. In addition to the control information being transmitted through control data, data from or to mobile station 110 may also be transmitted using control data. This is particularly the case when a limited amount of control data is available for transmission. As a result, control data may be efficiently used to convey data to and from mobile station 110. In this conventional wireless communication system, many different antennas may be used. However, only one antenna may be used at any given time. Hence, a plurality of antennas may receive the same information, wherein the antennas may be selected in a multiple antenna selection scheme. For example, an
